21 December 2019

Message from the Guest Editors

Dear Colleagues,

Micromanufacturing deals with the fabrication of structures in the order of 0.1 to 1000 µm. The scope of nanomanufacturing extends the size range of manufactured features to even smaller length scales below 100 nm. Both micro and nanomanufacturing can be considered as important enablers for high-end products. Especially, such products are enabled by micro and nanofeatures and structures to incorporate special optical, electronic, mechanical, fluidic or biological functions in existing and new emerging products and thus lead to unique selling points. This Special Issue is dedicated to recent advances in research and development within the field of micro- and nanomanufacturing. Therefore, papers are welcome that report recent findings and advances in manufacturing technologies for producing products with micro- and nanoscale features and structures. Furthermore, papers that report applications underpinned by advances in these technologies are also welcomed.
